

YEH PO-CHEN (葉柏辰)

TEL : 0930-695-996 EMAIL: lazpytb@gmail.com

Software Engineer specializing in Developer Productivity, Backend Systems, and AI-powered Engineering Automation.

EDUCATION

B.S. Computer Science and Information Engineering
National Taiwan University of Science and Technology (NTUST)

2025/09 ~ 2029/06

PROFESSIONAL SKILLS

Languages: TypeScript, Python, Go
Frameworks: React, Next.js, FastAPI
Infrastructure: Docker, PostgreSQL, Cloudflare Workers

EXPERIENCES

Software Engineer Intern, Shopback

2026/05 ~ 2026/07

- Built Playwright-based E2E automation covering critical web user flows, enabling reliable regression testing for new feature releases.
- Expanded Appium automation across Android and iOS applications, improving cross-platform testing coverage.
- Designed an agentic workflow that automatically updated E2E test scripts after UI changes, reducing maintenance effort by over 80%.
- Developed GitLab CI dashboards to visualize test coverage, execution status, and quality metrics for engineering teams.

Software Engineer Intern, National Center for High-Performance Computing

2025/10 ~ Recent

- Built full-stack web applications using React, FastAPI, and PostgreSQL to support large-scale research data workflows.
- Refactored backend services into a modular architecture with structured error handling, simplifying debugging and future feature development.
- Developed and maintained over 50 unit tests, reducing regression risks and improving backend reliability.
- Built data ingestion pipelines that imported CSV and Excel datasets into PostgreSQL, streamlining large-scale data processing.
- Improved backend scalability by contributing to API architecture and database schema optimization.
- Implemented OpenClaw File Browsing Helper, introducing secure file access and editing controls for enterprise environments.

Software Engineer, Picktrip startup team

2024/04 ~ 2024/10

- Built a full-stack internal platform using Node.js and React that automated operational workflows, increasing data analysis efficiency by 10×.
- Developed an embedding-based recommendation engine for personalized attraction discovery across large-scale tourism datasets.
- Analyzed user behavior using Python (Pandas, Matplotlib) to improve recommendation quality and user engagement.
- Led deployment infrastructure with Docker, Nginx, and CI automation, ensuring reliable production service delivery.

PROJECTS

MDSIG 2.0 Mingdao Student Collaborative Learning Community Online Forum | Next.js, Express.js, MongoDB, RESTful API, Nginx, JWT

- Served as the project manager for a four-person development team, successfully coordinating front-end and back-end development and design resources, establishing an efficient communication mechanism to ensure alignment with the school's requirements, and delivering the project on schedule.
- Responsible for Next.js front-end development, accurately implementing UI/UX design drafts, and introducing responsive web design (RWD) and server-side rendering (SSR) technologies.
- Led back-end system architecture design, optimized RESTful API structure, implemented pagination mechanisms and data caching strategies, effectively reducing API transmission load by 70% and improving overall system performance.

MDTC Mingdao Talent Cloud | Next.js, Express.js, MongoDB, RESTful API, Nginx, Prisma ORM, Cloudflare R2

- The forum project received recognition from the school and the principal, continuing to lead the same team in collaboration with the alumni association and the parent association to develop the Mingdao Talent Cloud.
- User-related files (resumes, other personal data) are stored using Cloudflare R2. By utilizing MongoDB and TTL mechanisms as a cache, the usage of Cloudflare's API is reduced, effectively lowering API costs.
- Next.js combined with Server Action is used to create an integrated front-end and back-end application.

AWARDS

- 2024 National Cybersecurity Competition High School Group, 3rd Place Nationwide (全國資安金盾獎)
- 2024 NCHC High Performance Application Competition (HiPAC), 3rd Place Nationwide (國研院國網中心應用程式效能優化競賽)
- 2023 g0v Sch001 Project Incubator Competition, Selected as a Seed Team (g0v 零時小學校專案孵化競賽)
